

# Evidence for adaptive translation in *S. sclerotiorum*

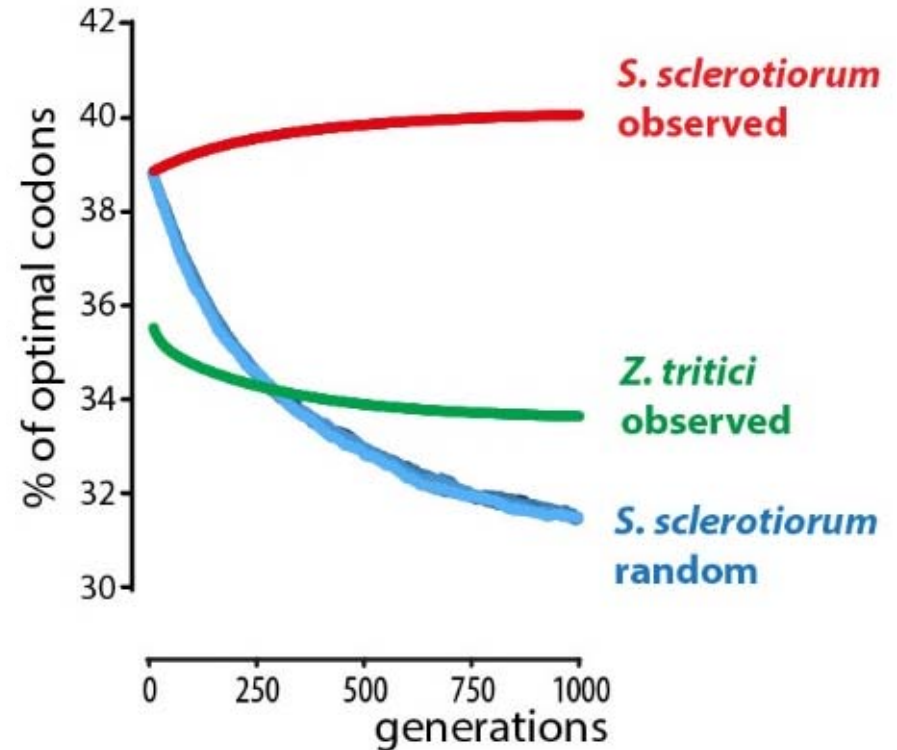

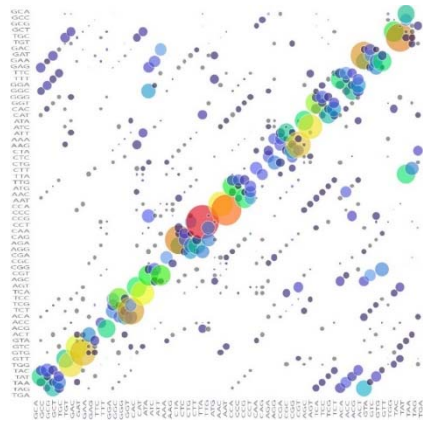

- Codon substitution matrix

## *Zymoseptoria tritici*

Hosts: Wheat (1 species)  
 9 Swiss isolates  
 14 571 coding SNP/isolate  
 Source: Croll *et al.* Plos Patho. 2013

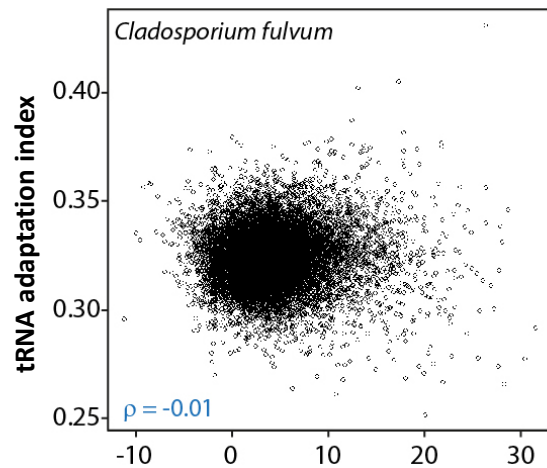

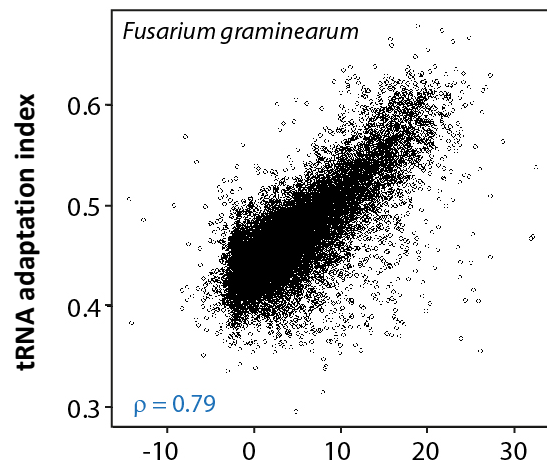

- SNP patterns in *S. sclerotiorum* supports increased translation efficiency

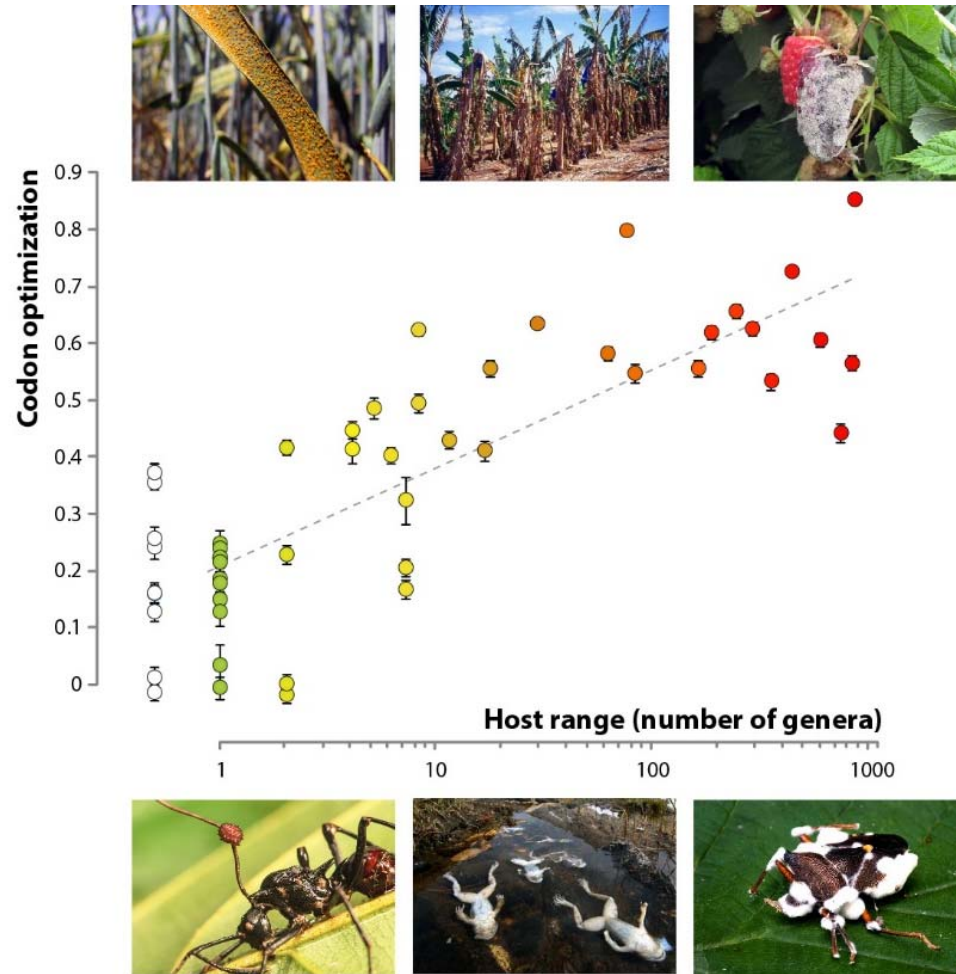

*Is this evolutionary pattern related with Sclerotinia lifestyle?*

# Codon adaptation correlates with host range in Fungi

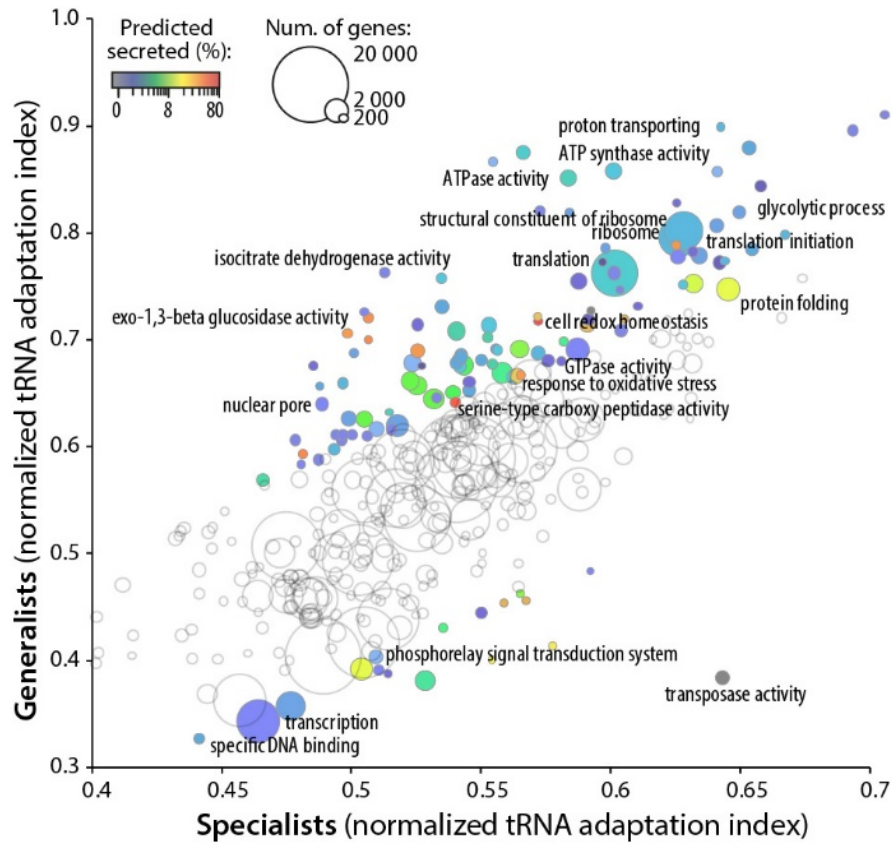

Adaptive translation at the genome scale

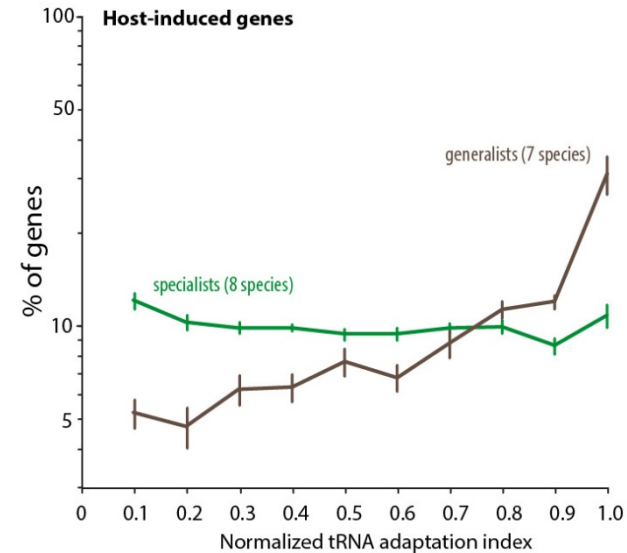

Effective number of codons

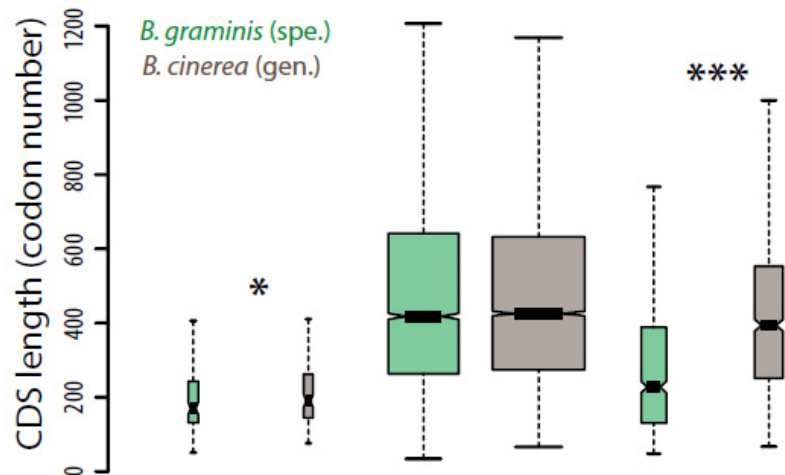

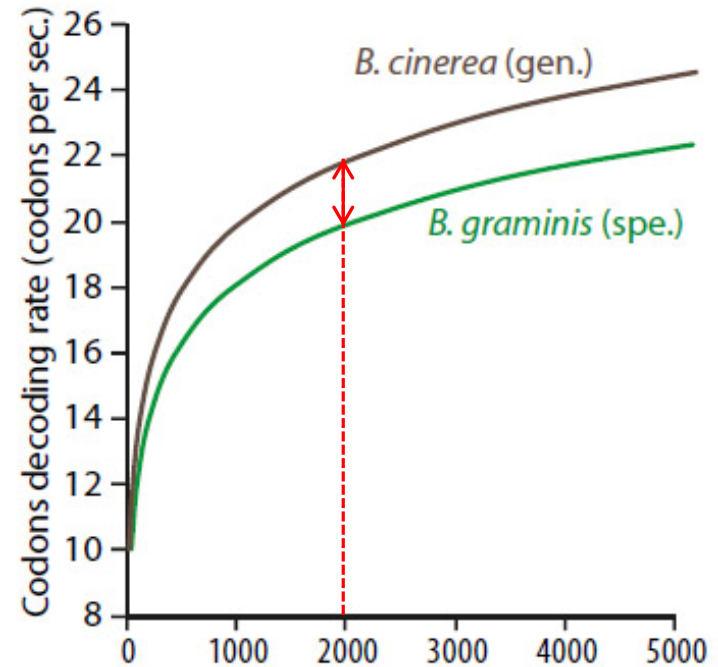

# Codon adaptation is stronger in infection-related genes

- Codon optimization reduces the 'cost of production' of all effectors simultaneously

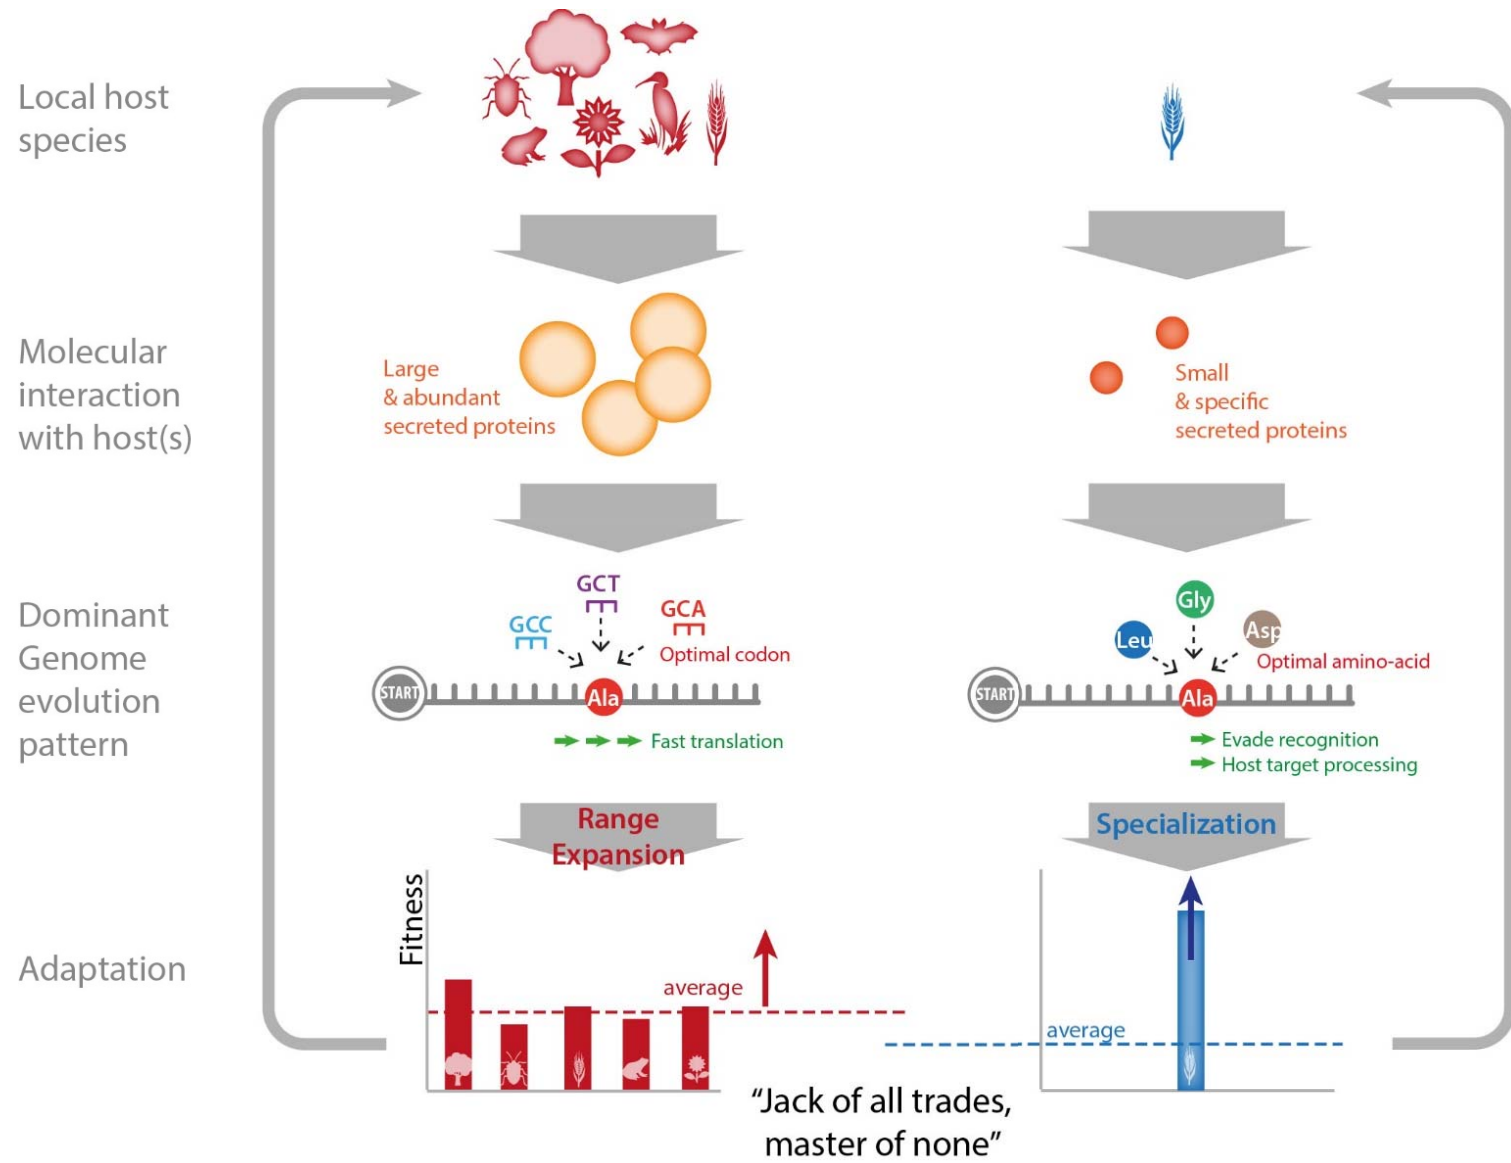

# Why is adaptive translation stronger in generalist fungi?

- *B. cinerea* must decode codons faster to reach the same growth rate as *B. graminis*

# Conclusion: Adaptation to multiple hosts at the codon level

# 2

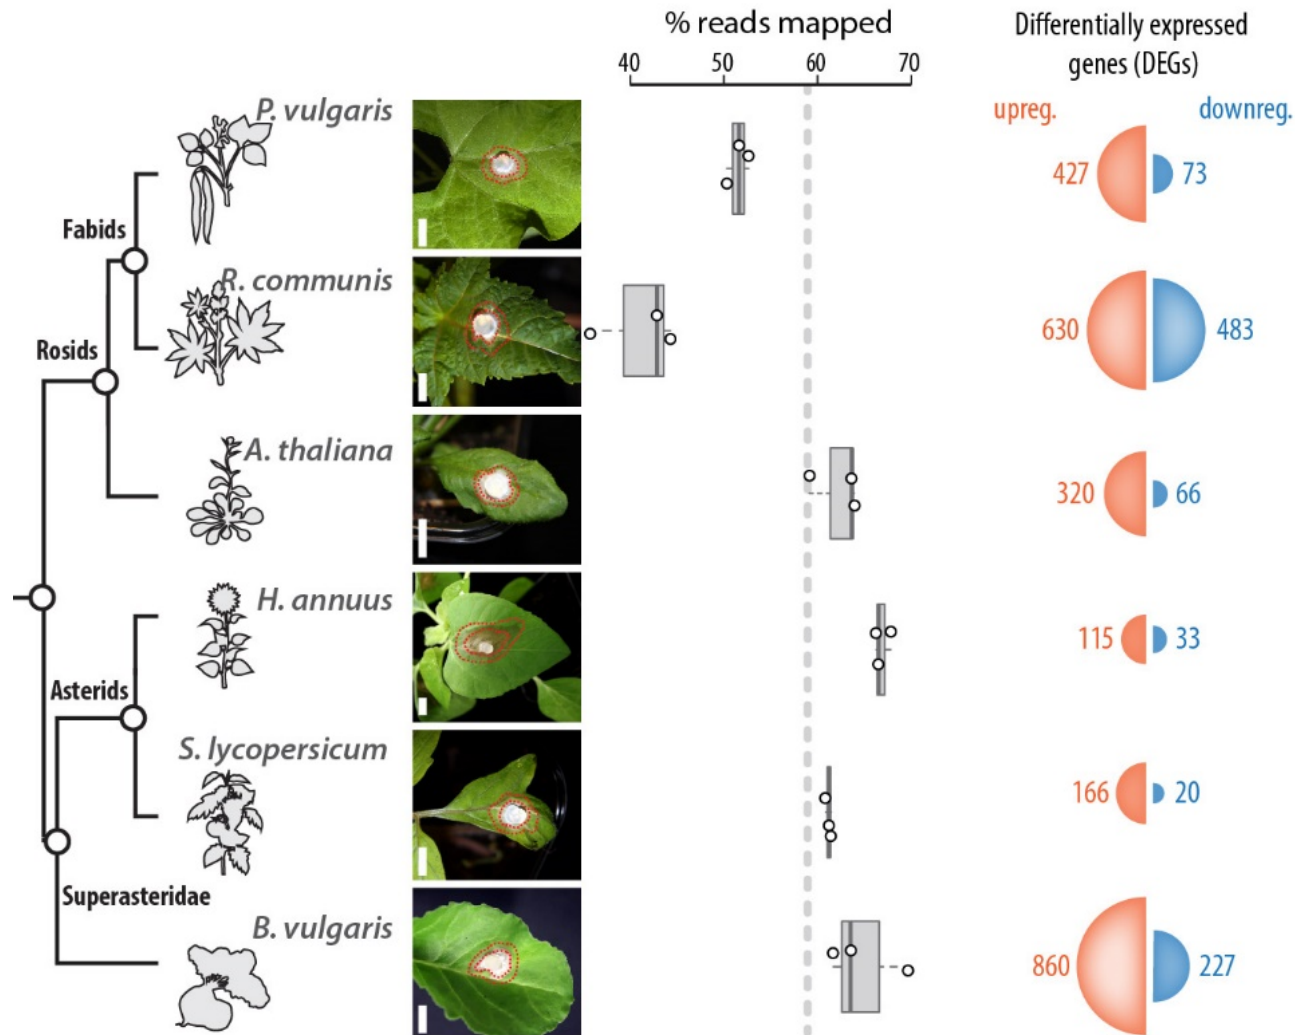

## **Transcriptional plasticity and host range expansion**

Ingredients:

Transcriptomics (RNAseq), comparative genomics

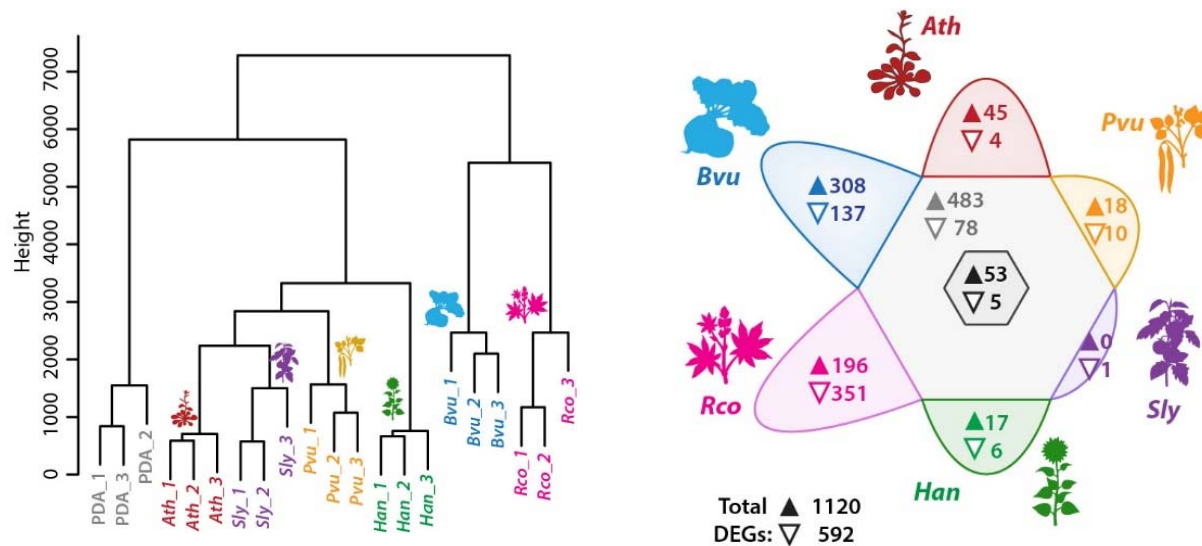

# *S. sclerotiorum* transcriptome: one pattern fits all hosts?

RNAseq on hosts from 6 botanical families

Strong variation in DEG number according to host

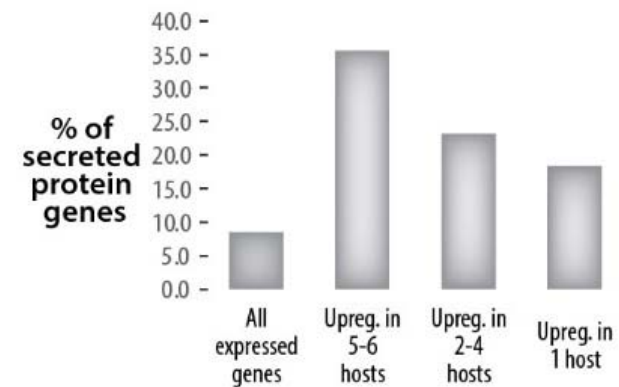

# *S. sclerotiorum* host-specific transcriptome

4.7% of DEGs up on all hosts

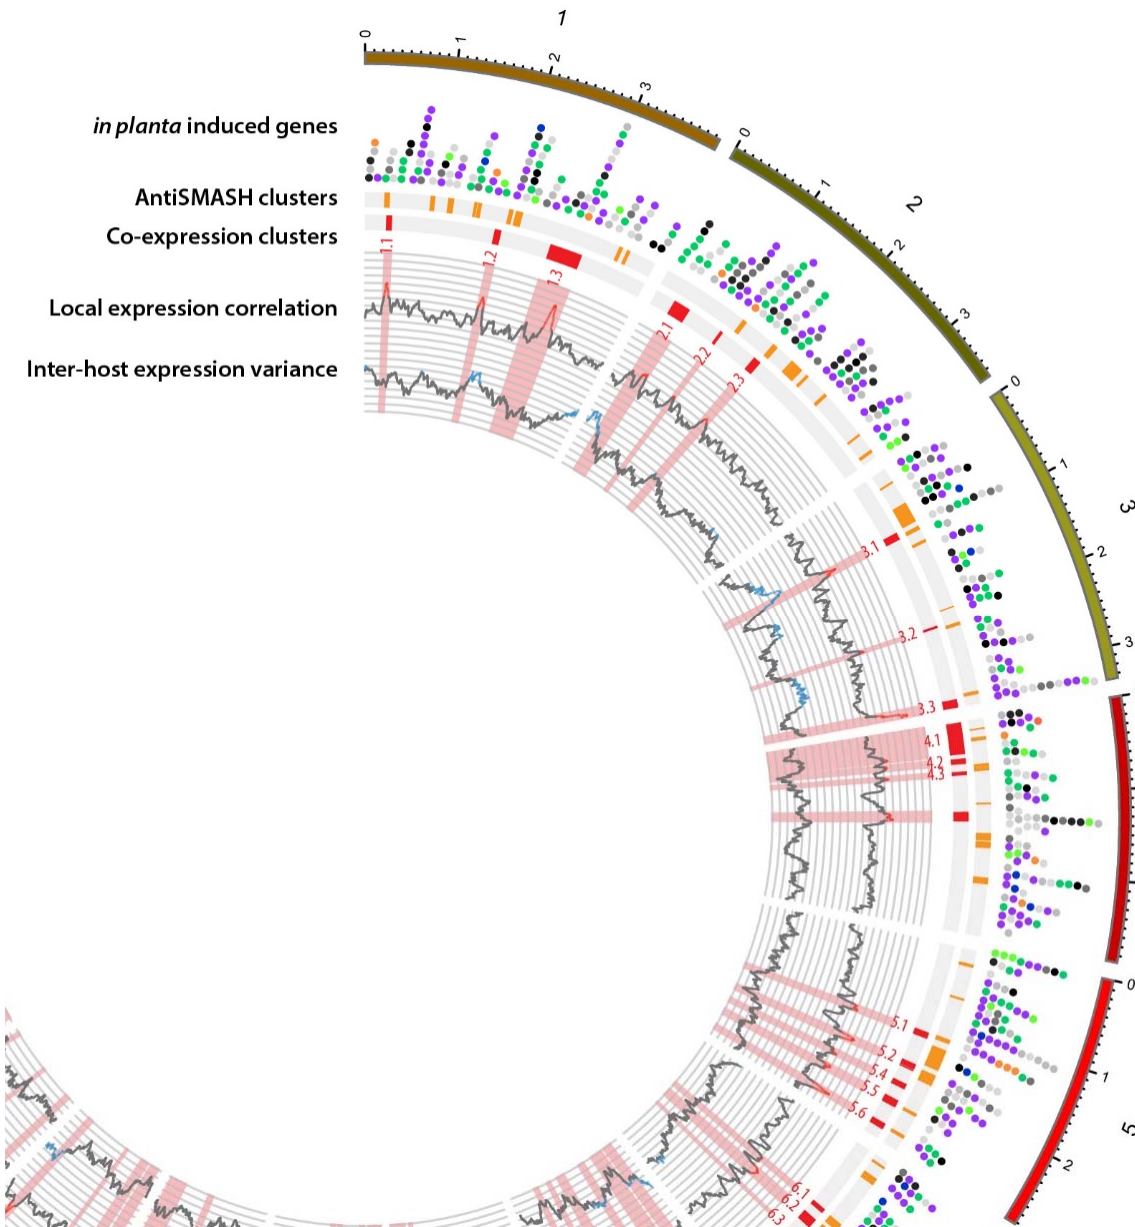

Some hosts trigger specific reprogramming

## Host specific signatures of gene family regulation

# Generalist and host-specialized genomic clusters

~17% of host-induced genes occur in 58 clusters

Some are host-specialized

# *S. trifoliorum* genome assembly

- S. trifoliorum* is non pathogenic on Brassicales

*S. sclerotiorum*  
Fr.B5  
▽

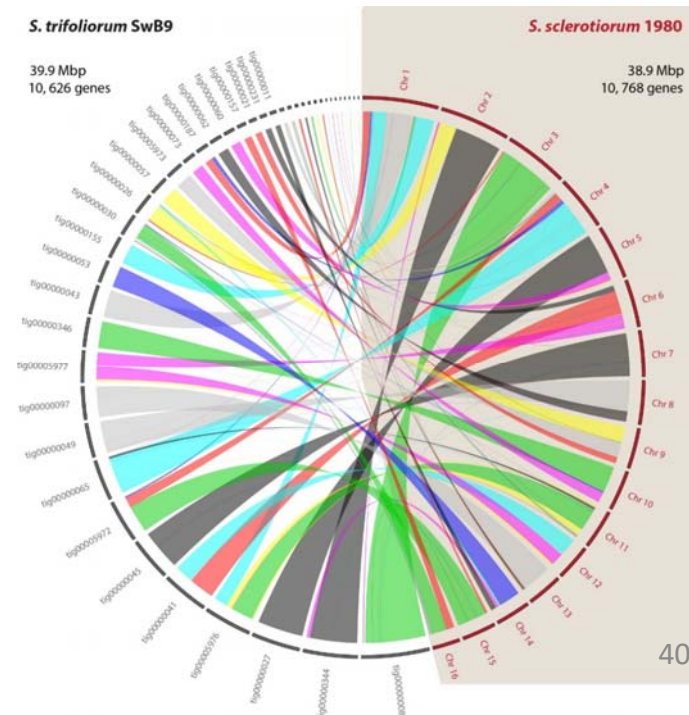

*S. trifoliorum*  
Sw.B9  
▽

Evolution of *A. thaliana*-specific upregulated genes in the *Sclerotinia* lineage ?

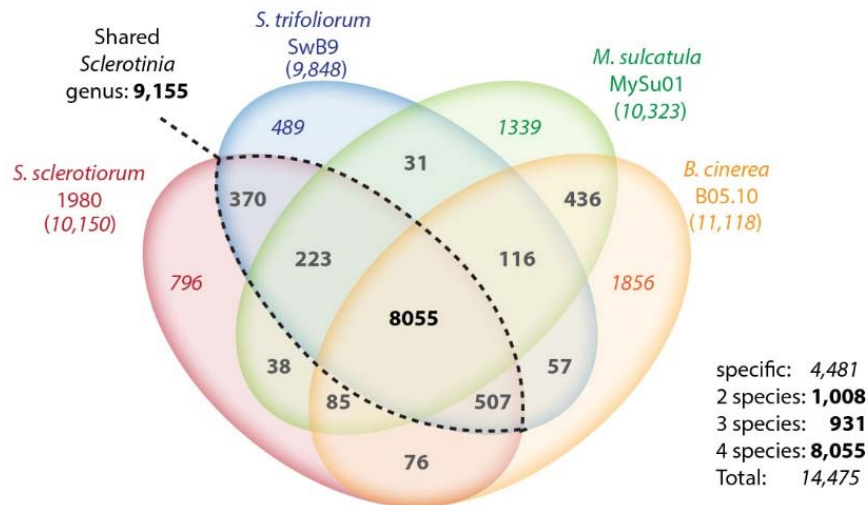

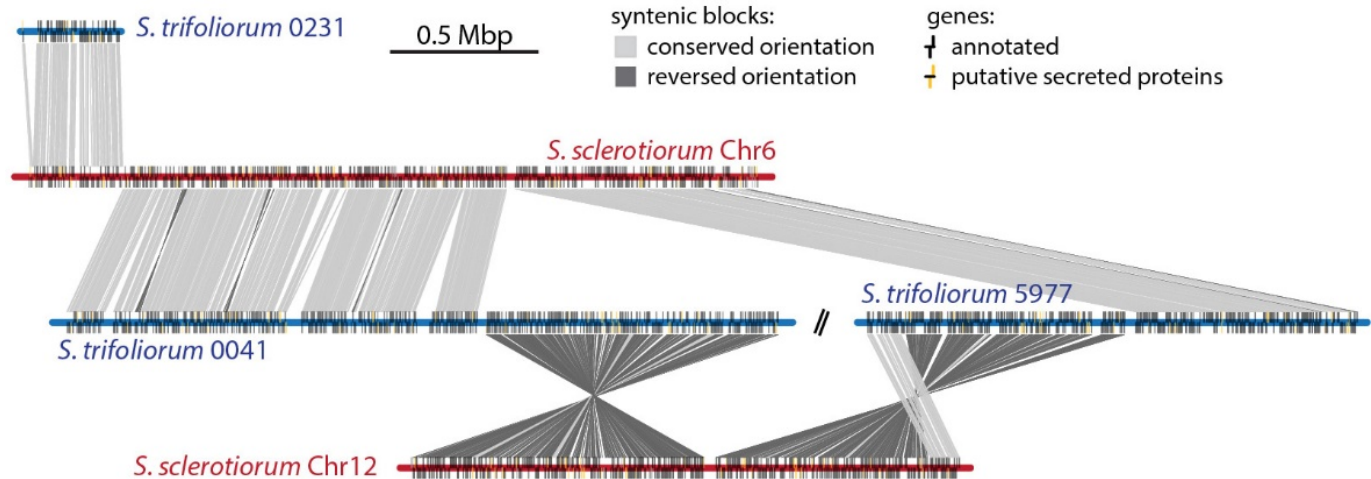

Nanopore sequencing of *S. trifoliorum* SwB9

Annotation: 10 626 protein-coding genes

# *S. trifoliorum* genome assembly

Synteny with *S. sclerotiorum*

42/45 *S. sclerotiorum* genes upregulated specifically on *A. thaliana* have orthologs in *S. trifoliorum*

Importance of genes acquired prior to the divergence between *S. sclerotiorum* and *S. trifoliorum*

# How does *S. trifoliorum* respond to Brassicales phytoalexins ?

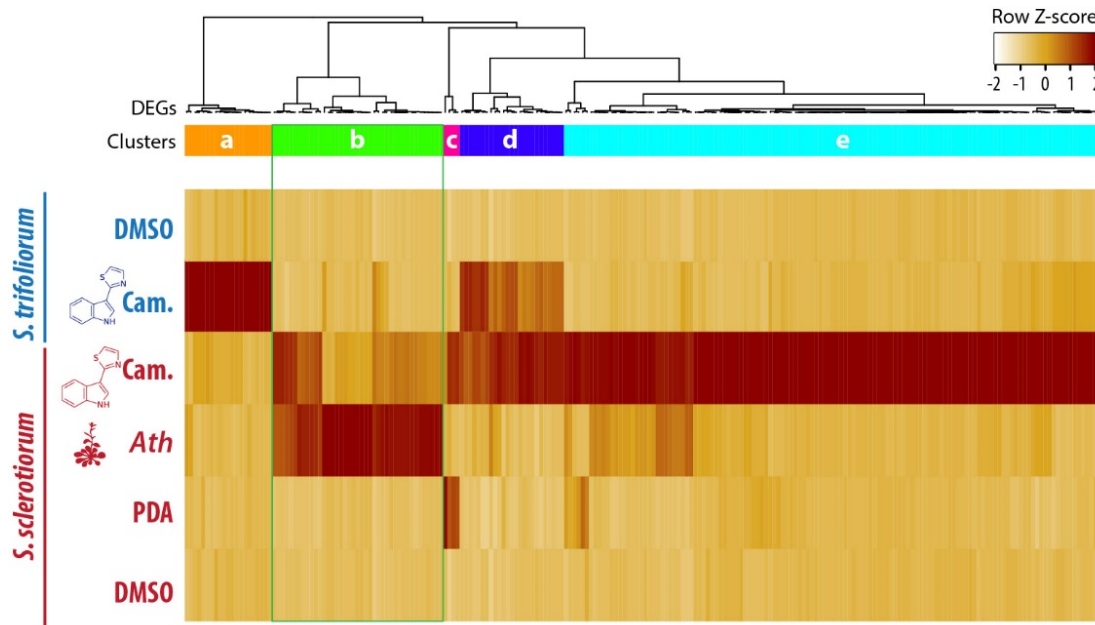

- *S. trifoliorum* shows enhanced susceptibility to camalexin

# *S. trifoliorum* transcriptome is « blind » to camalexin

70 *S. sclerotiorum* genes induced during *Arabidopsis* infection and by camalexin

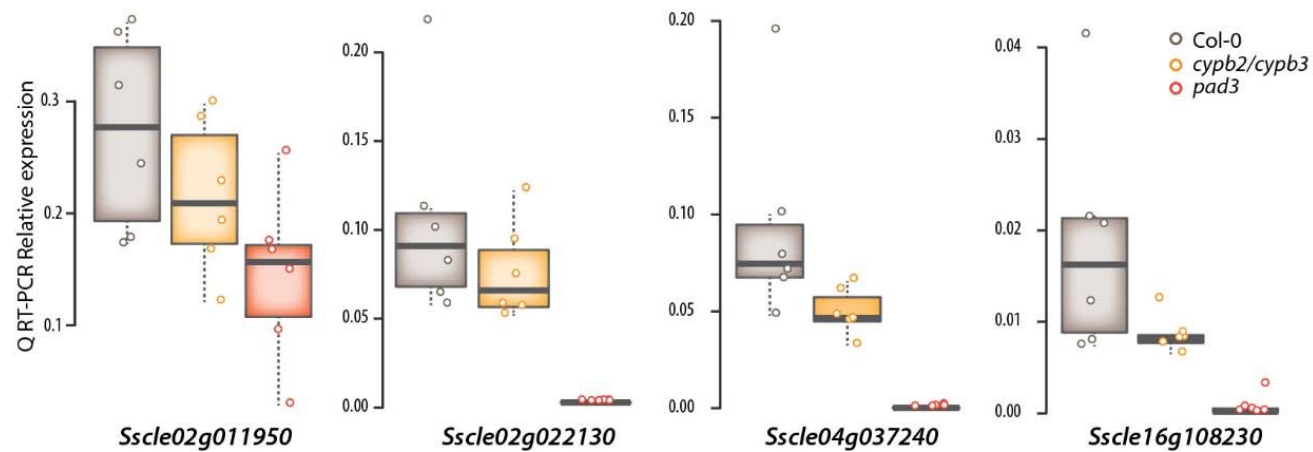

Responsiveness to camalexin associated with expansion of *Sclerotinia* host range

# host-specific cues activate plant responsive genes in *S. sclerotiorum*

~~camalexin~~  
~~camalexin~~  
~~Indole gluc.~~

Stotz *et al.*, Plant Journal 2011

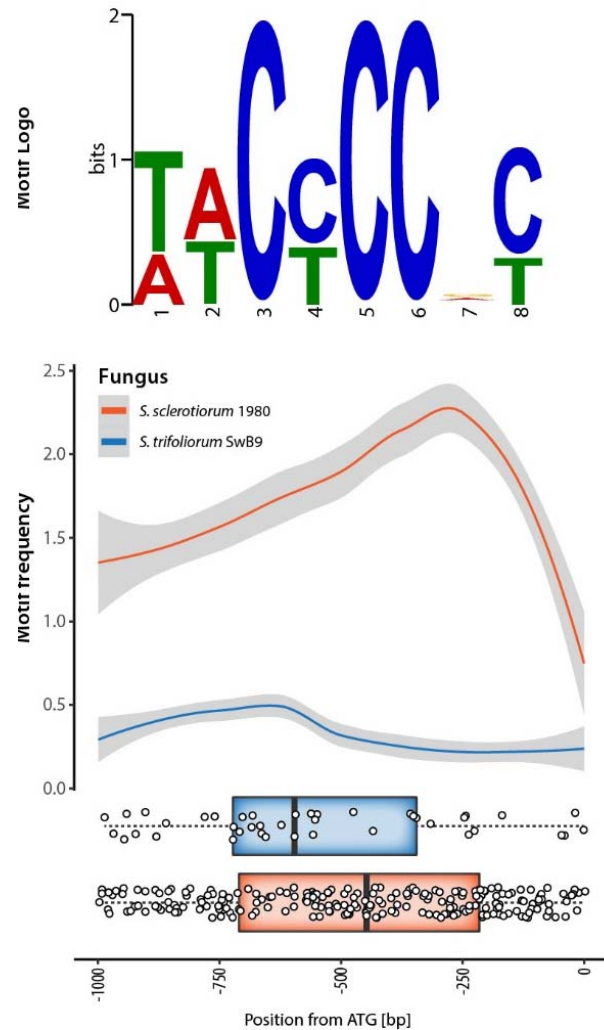

# *S. Sclerotiorum* host-specific genes are well conserved

649 fungal species

# Cis-regulatory variation & host range expansion

Motif in promoter of *S. sclerotiorum* host-specific genes

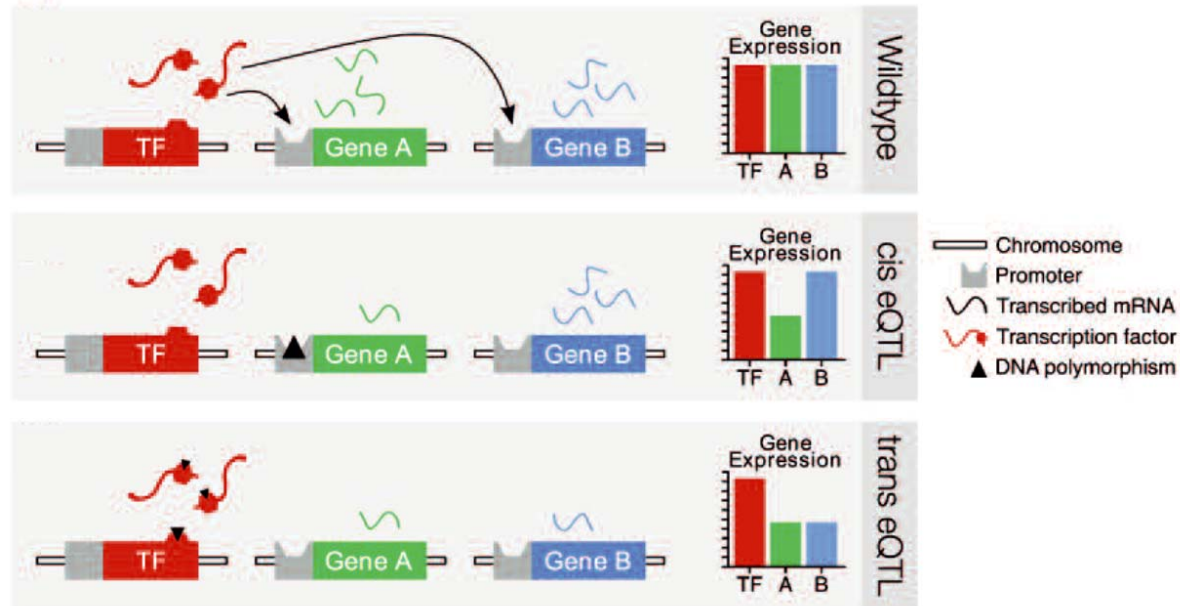

Predicted binding transcription factors

# Host adaptation through regulatory variation

Reduced deleterious pleiotropic effect

Evolvable with limited gene flow

# 3

## **Division of labor supports the colonization of resistant plants**

Ingredients:

Transcriptomics (RNAseq), modelling

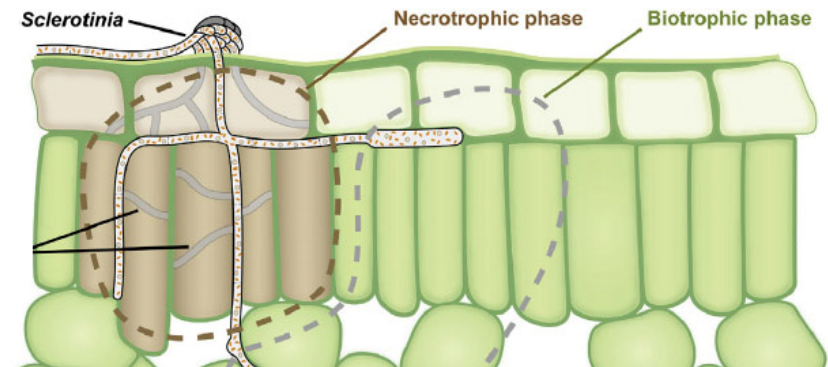

# *S. sclerotiorum* forms heterotypic colonies *in planta*

OAH1:GFP-expressing *S. sclerotiorum*

Adapted from Lumsden & Low 1973

Kabbage *et al.* 2015

*How is this reflected at the molecular level ?*

# *S. sclerotiorum* transcriptome reprogramming during plant colonization

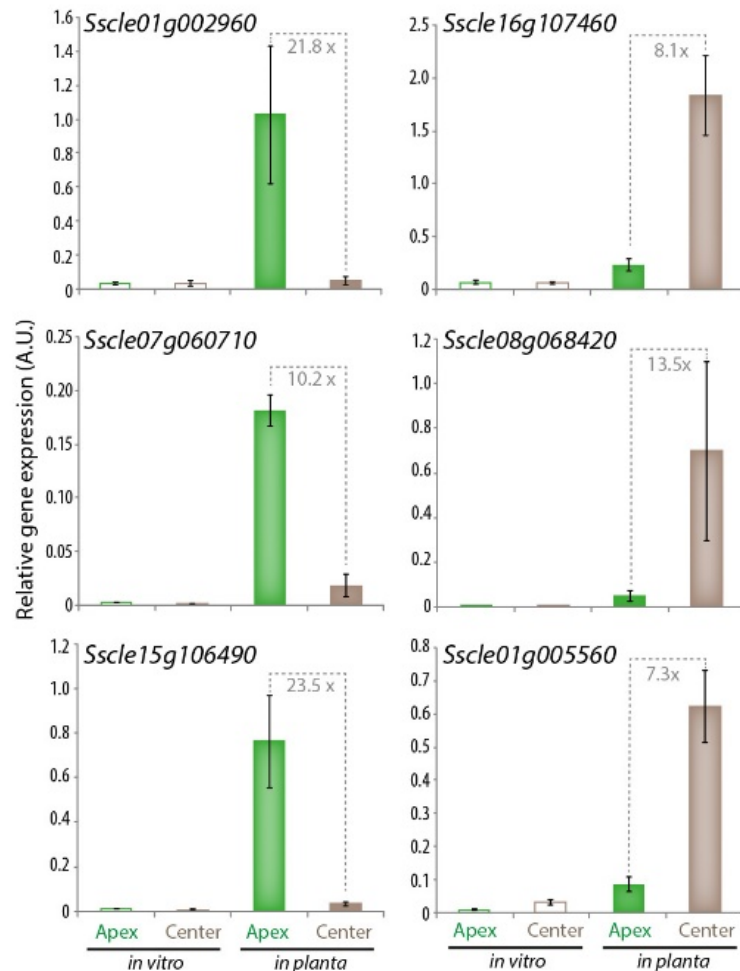

580 (51.2%) genes are area-specific  
 627 (55.4%) were induced *in planta* only

- Co-existence of 2 distinct transcriptional states *in planta*
- Host colonization triggers highly divergent reprogramming of fungal cells

# Local reprogramming of *S. sclerotiorum* colonies *in planta*

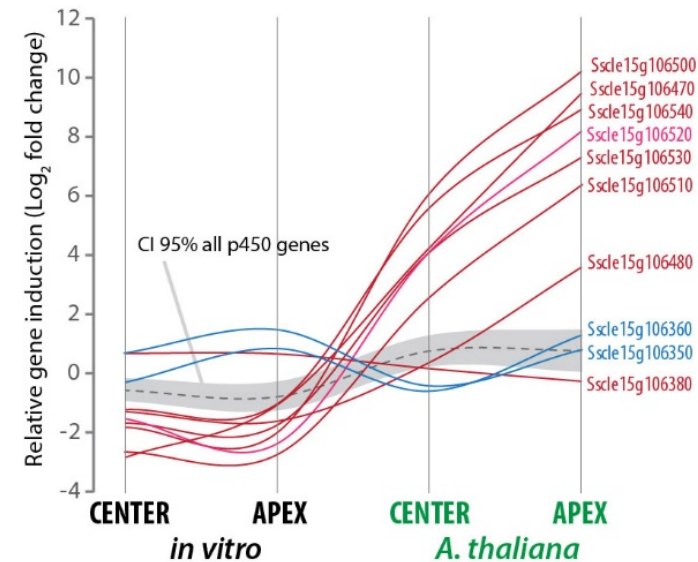

- The expression of some fungal genes is restricted to specialized cells

Botcinic acid cluster (Chr. 15)

- Core biosynthetic genes
- Additional biosynthetic genes
- Transport-related genes

**How (much) does local reprogramming affect hyphal cells functions?**

# Analysis of major cell functions performed locally with a genome-scale metabolic model

Model features	Metabolic module	PCW deg. module
<b>Reactions</b>		
◆ Biomass biosynthesis	291	0
◆ Central metabolism	89	0
◆ Cofactor biosynthesis	77	0
◆ Degradation pathway	280	83
◆ Exchange	213	135
◆ Regulation	6	0
◆ Salvage pathway	9	0
◆ Secondary metabolism	33	0
◆ Sink	14	0
◆ Transport, external	183	0
◆ Transport, internal	82	0
<b>Total</b>	<b>1277</b>	<b>218</b>
<hr/>		
● Metabolites		
<hr/>		
<b>Genes</b>	919	120

- Reconstruction of *S. sclerotiorum* Genome-scale Metabolic model
- Cell-scale analysis, quantify metabolic 'cost', make simulations

# Metabolic heterogeneity in *S. sclerotiorum*

Experimental growth on 288 metabolites using Biolog - compared to model predictions

16 pathways with fluxes apex > center during *A. thaliana* colonization

C flux towards major virulence functions is 8.5x higher in apex cells

# Division of labor (DOL): a solution to optimization problems

DOL = different tasks are executed by specific and specialized modules

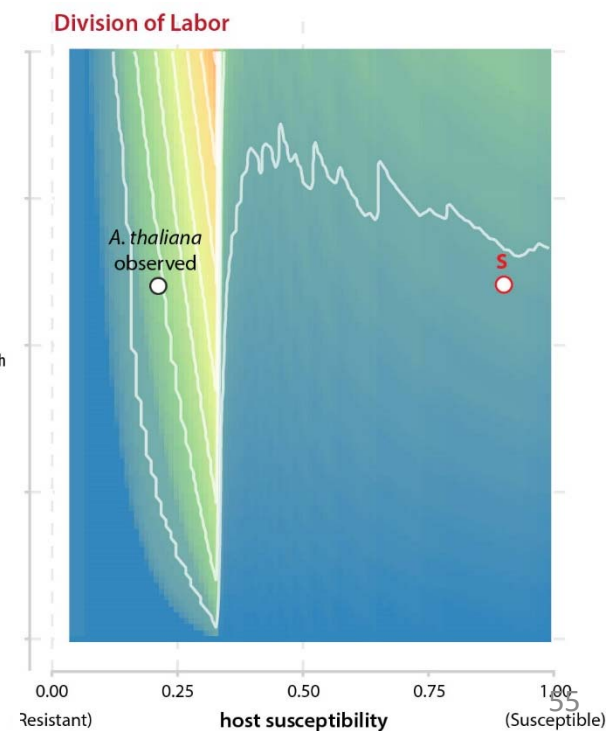

- Center cells 'feed' apex cells to afford the cost of effectors production

Subversion (S)  
Virulence (V)  
Detoxication (D)  
Storage (S)  
Assimilation (A)  
Growth (G)

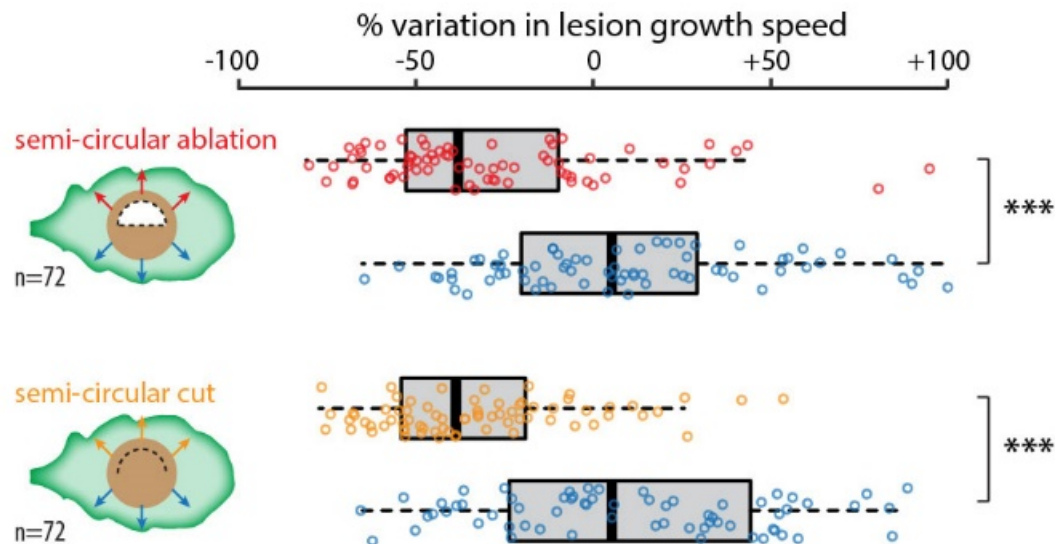

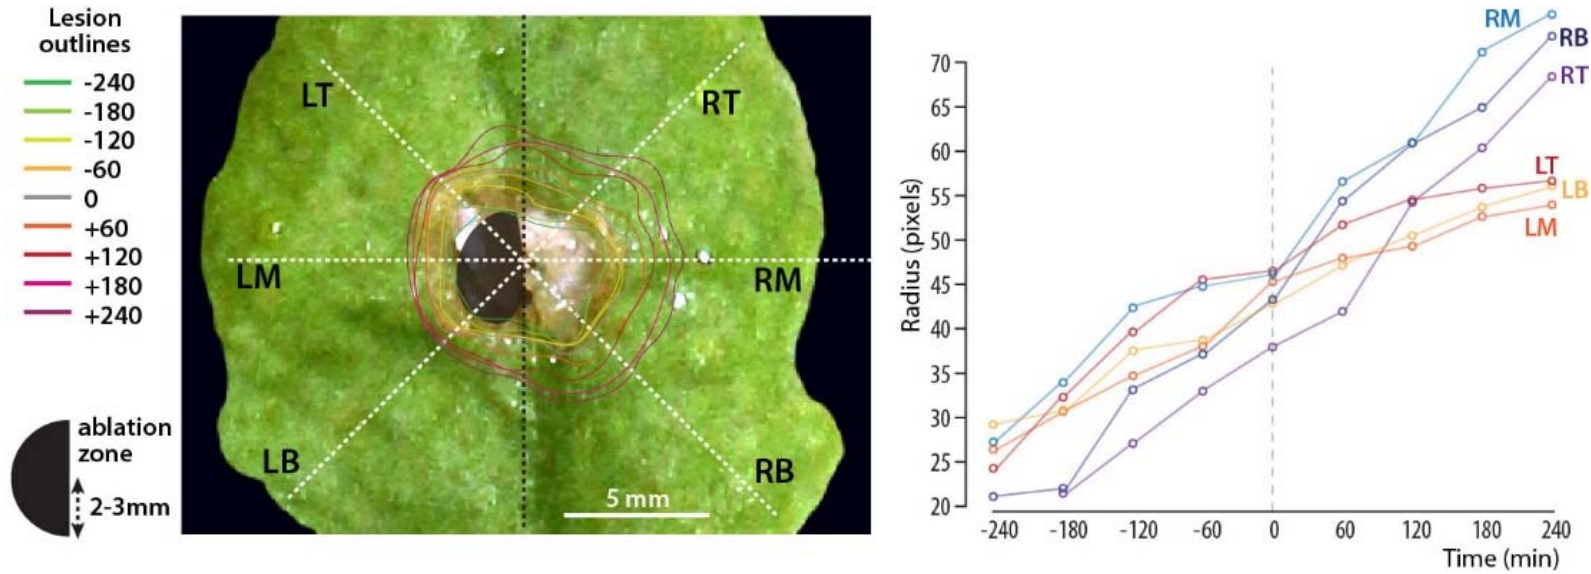

*Is there a selective advantage of DOL in *S. sclerotiorum*?*

# DOL enables the colonization of resistant hosts

# Cooperation promotes host colonization

- Growth penalty to hyphae downstream of cut center cells only

# The gain from cooperation is higher on resistant hosts

- Disconnection from center reduces the colonization of *A. thaliana* and *N. benthamiana*

- Plant more resistant (eg At vs Nb) = Higher gain from cooperation

Cooperation promotes host colonization

# Conclusions

# Take home: both generalist and polyspecialist

- Adaptive protein translation
- Division of labor and cooperation

- Host-specialized gene clusters

**Molecular bases?**

*more...?*

# The whole is more than the sum of its parts

- A 3-component system

Green=  
Emergent property

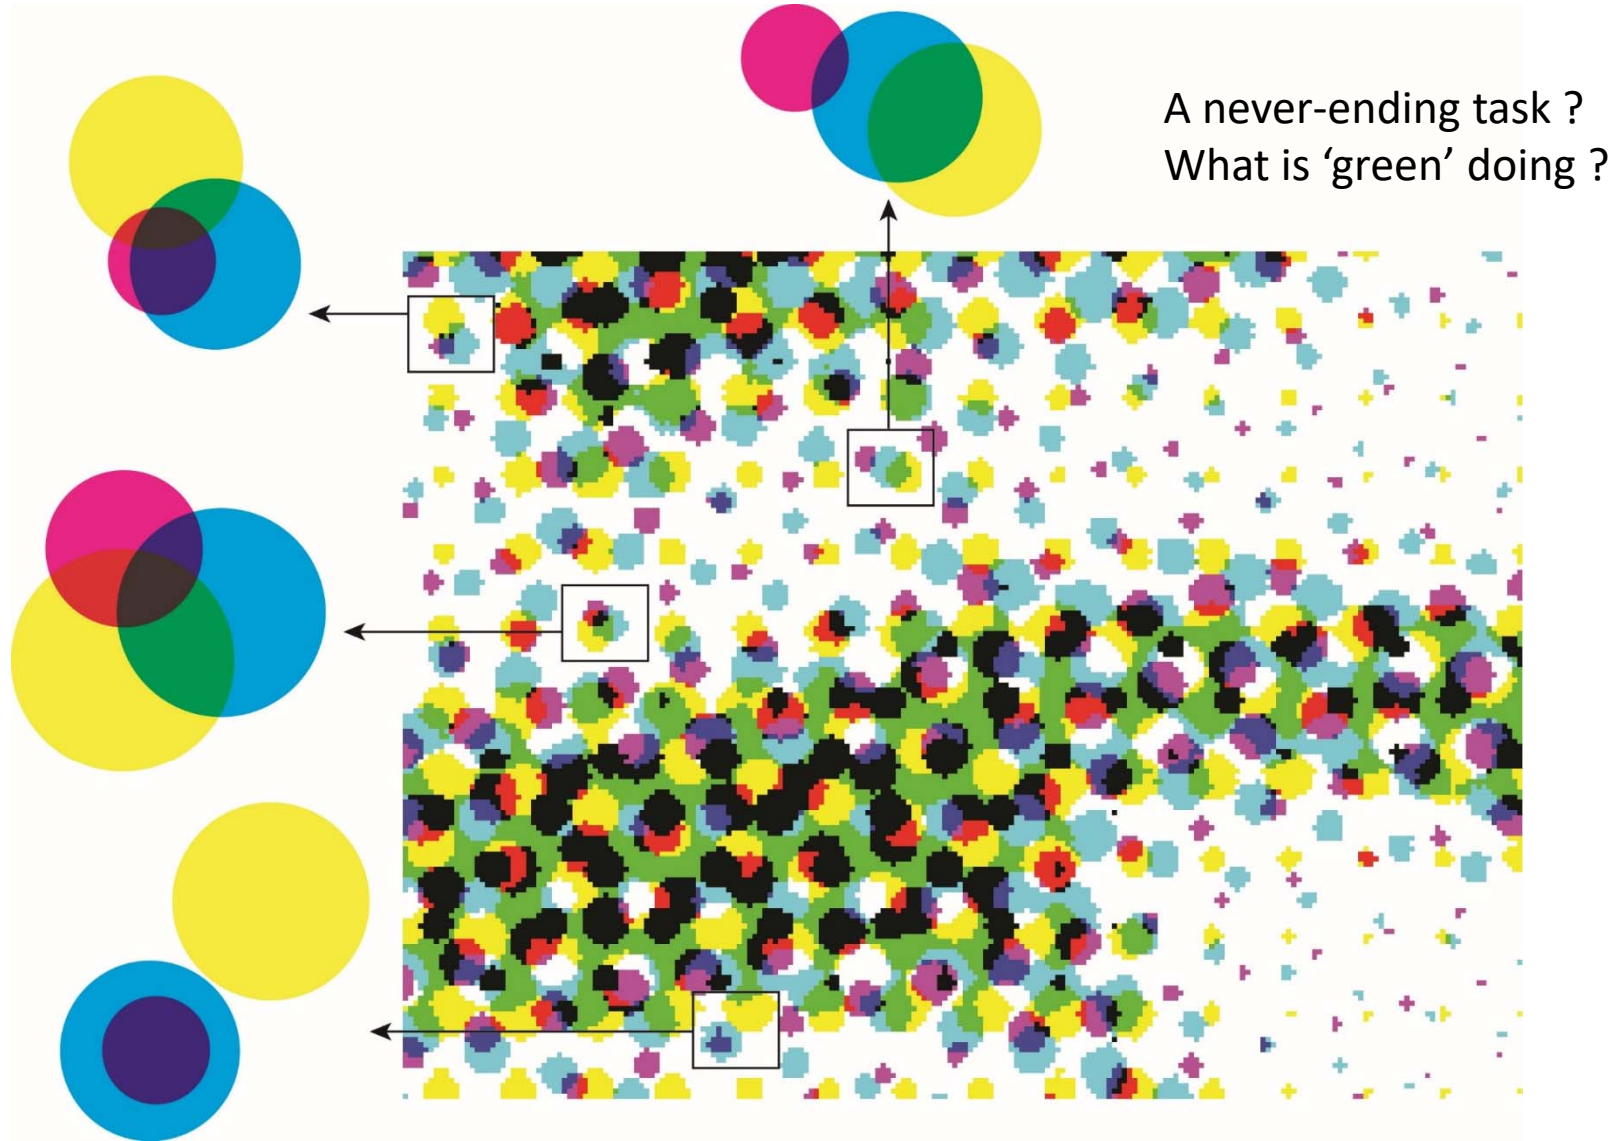

- >>3 outcomes

Sometimes yellow + cyan ≠ green

# The whole is more than the sum of its parts

- Mapping the multiple states of the system

# The whole is more than the sum of its parts

- Inferring global patterns from incomplete local information (modeling)

- Testing for un-anticipated Molecular functions

- Emerging property at high-order

> *Effect on organism physiology/fitness*

**Maths models reveal phenotypes emerging from molecular events**

# Science is teamwork!
